

Graves 2013, “Generating Sequences with Recurrent Neural Networks”

Johannes Bausch and Jack Kamm

14 November 2017

Outline

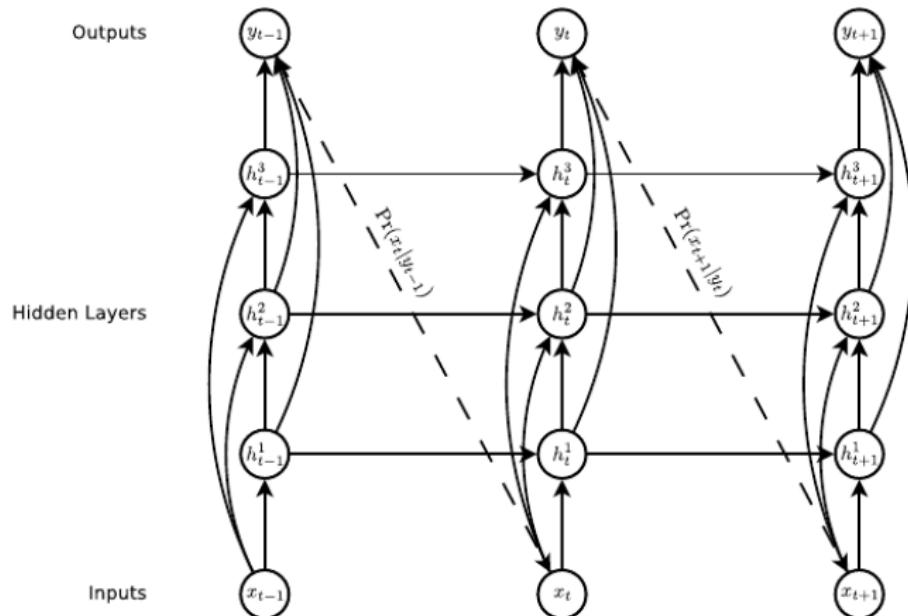

- 1 RNN and LSTM
- 2 Learning and Generating Sequences
- 3 Generating handwriting

Table of Contents

1 RNN and LSTM

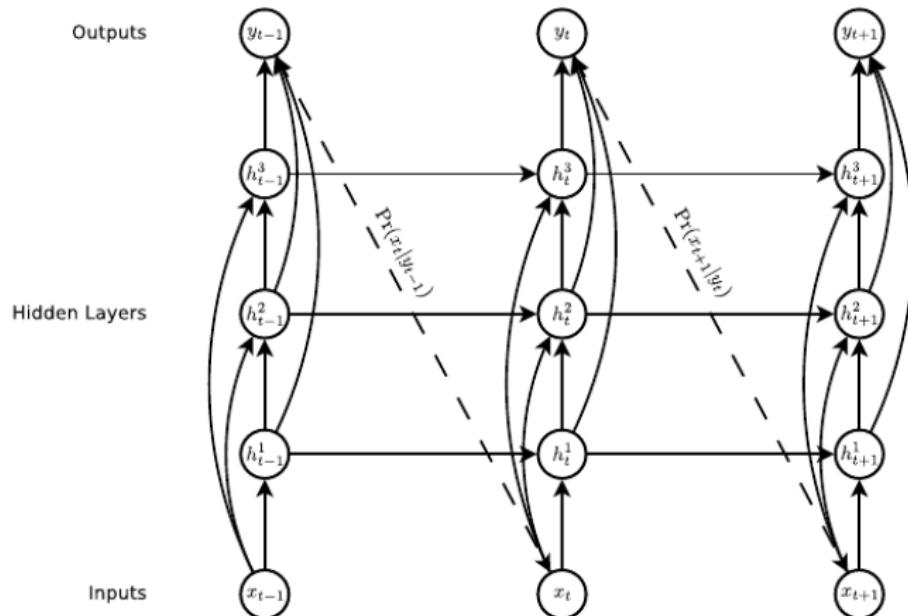

3 Generating handwriting

Recurrent Neural Networks

Input x_t , hidden layers h_t^n , output y_t , generative model $\mathbb{P}(x_{t+1} \mid y_t)$

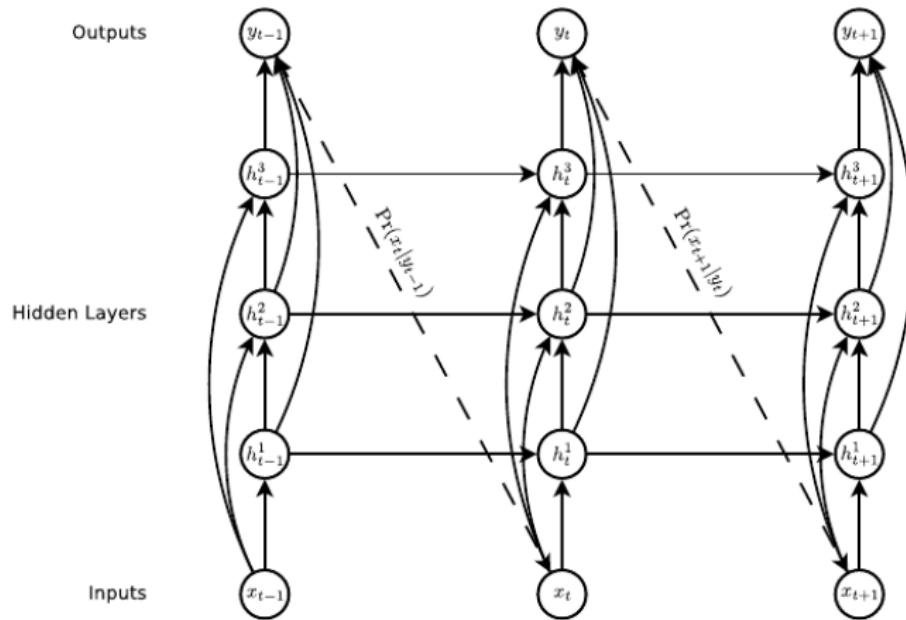

Recurrent Neural Networks

h_t^n = nonlinear link \circ affine combo of x_t , h_{t-1}^n , h_t^{n-1}

$$h_t^n = \mathcal{H}(W_{ih^n}x_t + W_{h^{n-1}h^n}h_t^{n-1} + W_{h^nh^n}h_{t-1}^n + b_h^n)$$

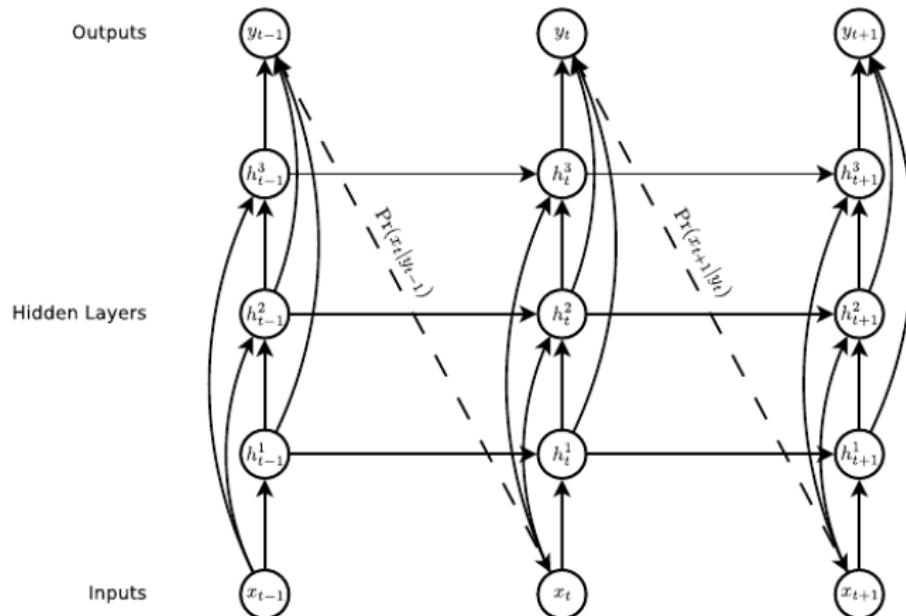

Recurrent Neural Networks

y_t = nonlinear link \circ affine combo of h_t^n

$$y_t = \mathcal{Y}(b_y + \sum_{n=1}^N W_{h^n y} h_t^n)$$

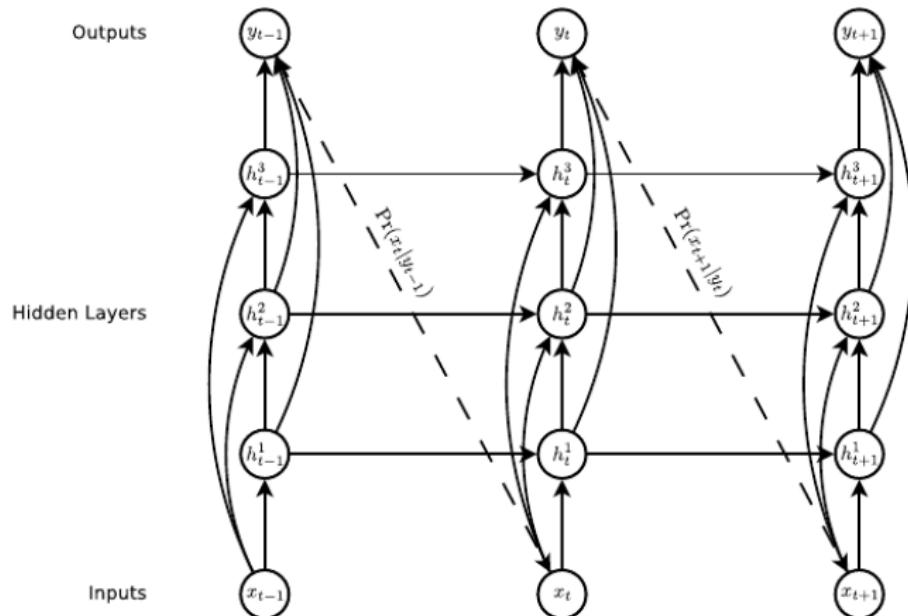

Recurrent Neural Networks

Train by maximizing likelihood of generative model:

$$\mathbb{P}(\mathbf{x}) = \prod_{t=1}^T \mathbb{P}(x_t \mid y_{t-1})$$

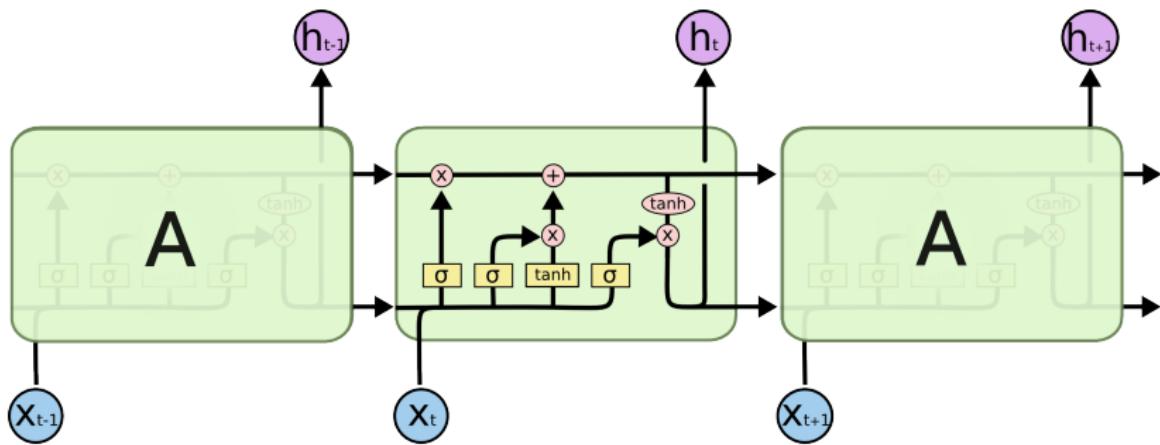

Recurrent Neural Networks

Compute $\nabla_{\Theta} \log \mathbb{P}_{\Theta}(\mathbf{x})$ by "truncated backpropagation through time"

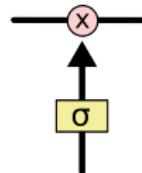

- i.e., reverse chain-rule + "clip" exploding derivatives

Long short term memory¹

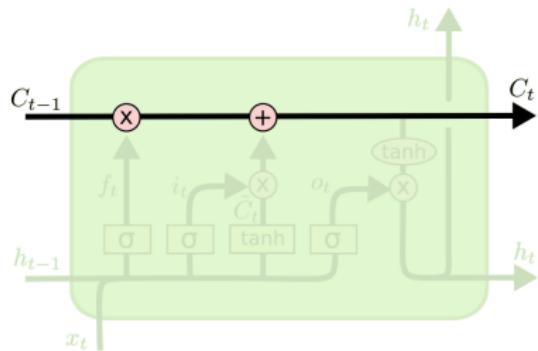

Information passes through a series of “gates”

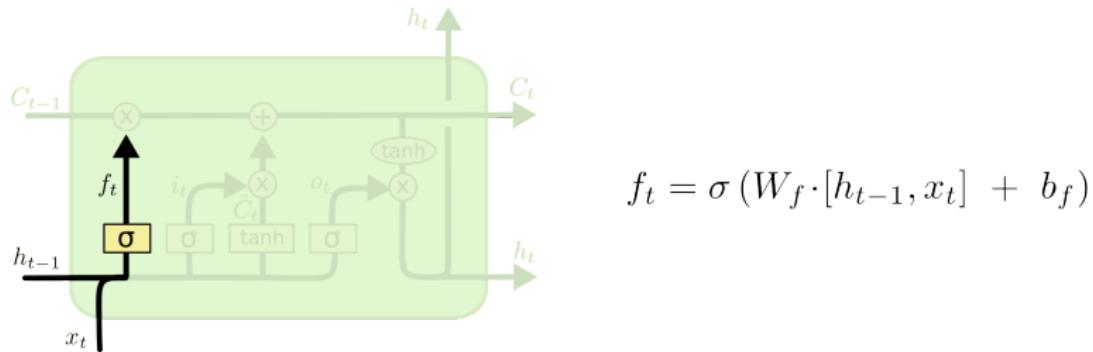

- “Gate” = multiplication with sigmoid
 - $\sigma = 0 \Rightarrow$ “let nothing thru”
 - $\sigma = 1 \Rightarrow$ “let all thru”

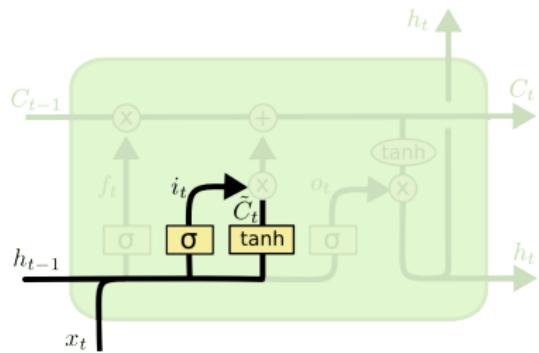

¹graphics have slight differences with Graves 2013; they are taken from:
<https://colah.github.io/posts/2015-08-Understanding-LSTMs>

C_t = “cell state” = flows horizontally across LSTM units

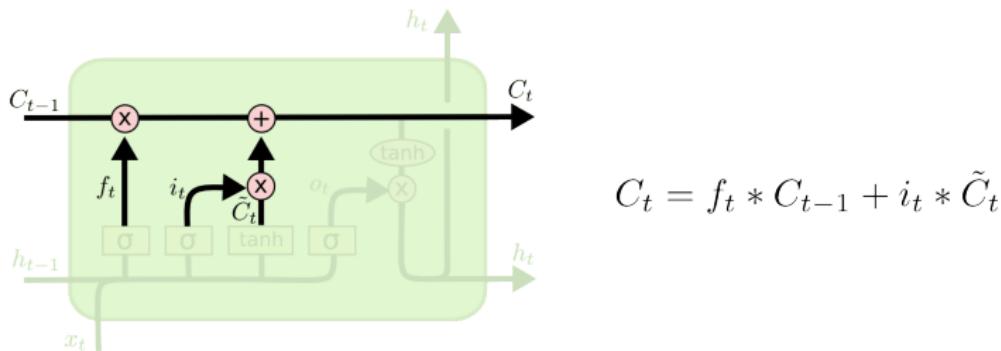

f_t = “forget gate” = gate to forget information from C_{t-1}

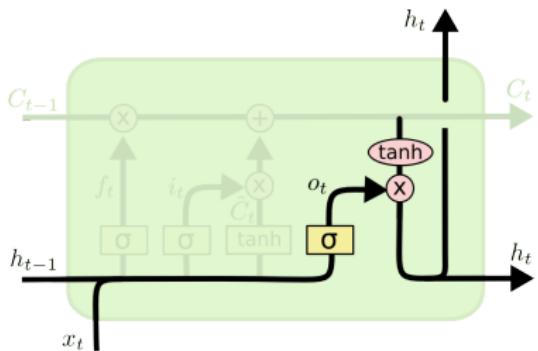

$$i_t = \sigma(W_i \cdot [h_{t-1}, x_t] + b_i)$$

$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] + b_C)$$

i_t = “input gate” = gate to add information from h_{t-1} and x_t to C_t

Update C_t using f_t and i_t

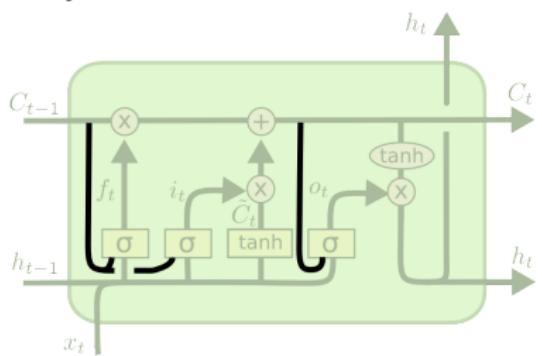

$$o_t = \sigma(W_o [h_{t-1}, x_t] + b_o)$$

$$h_t = o_t * \tanh(C_t)$$

o_t = “output gate” = gate to output information to cell above/right

Many variations on LSTM exist. Here is the one used in Graves 2013:

$$f_t = \sigma(W_f \cdot [C_{t-1}, h_{t-1}, x_t] + b_f)$$

$$i_t = \sigma(W_i \cdot [C_{t-1}, h_{t-1}, x_t] + b_i)$$

$$o_t = \sigma(W_o \cdot [C_t, h_{t-1}, x_t] + b_o)$$

Notice the extra “peephole” connections from C to f, i, o

Table of Contents

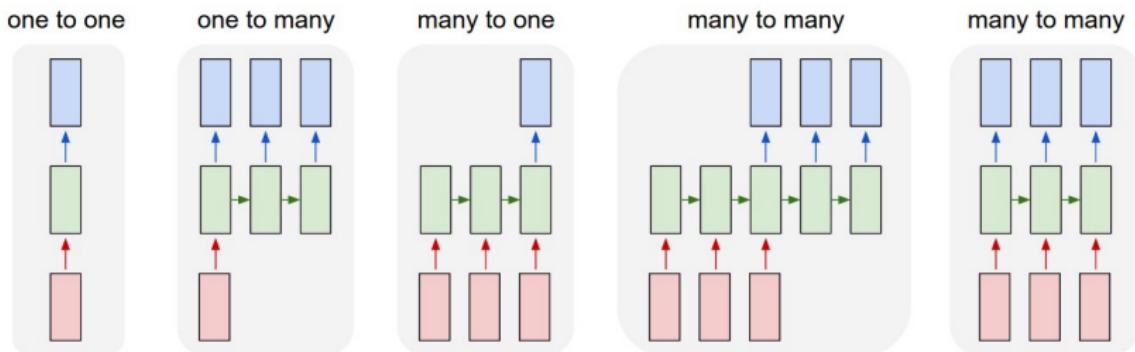

1 RNN and LSTM

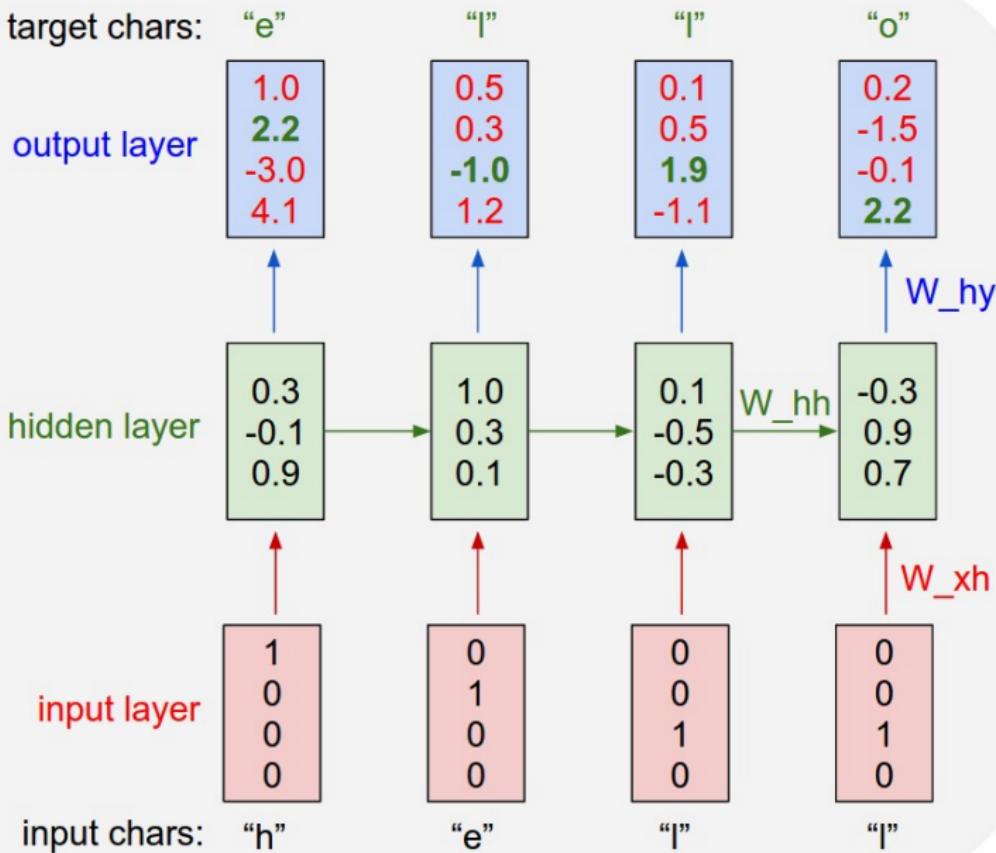

2 Learning and Generating Sequences

3 Generating handwriting

Text Prediction

How do we model a NN that takes a variable input length?
(<http://karpathy.github.io/2015/05/21/rnn-effectiveness/>).

RNN and LSTM Shakespeare

We compare an RNN with an LSTM to predict Shakespeare.

LSTM Shakespeare

KING LEAR:

O, if you were a feeble sight, the courtesy of your law,
Your sight and several breath, will wear the gods
With his heads, and my hands are wonder'd at the deeds,
So drop upon your lordship's head, and your opinion
Shall be against your honour.

LSTM Wikipedia

Naturalism and decision for the majority of Arab countries' capitalide was grounded by the Irish language by [[John Clair]], [[An Imperial Japanese Revolt]], associated with Guangzham's sovereignty. His generals were the powerful ruler of the Portugal in the [[Protestant Immineners]], which could be said to be directly in Cantonese Communication, which followed a ceremony and set inspired prison, training. The emperor travelled back to [[Antioch, Perth, October 25|21]] to note, the Kingdom of Costa Rica, unsuccessful fashioned the [[Thrales]], [[Cynth's Dajoard]], known in western [[Scotland]], near Italy to the conquest of India with the conflict.

LSTM LAT_EX

For $\bigoplus_{m=1,\dots,m} \mathcal{L}_{m\bullet} = 0$, hence we can find a closed subset H in \mathcal{H} and any sets \mathcal{F} on X , U is a closed immersion of S , then $U \rightarrow T$ is a separated algebraic space.

Proof. Proof of (1). It also start we get

$$S = \text{Spec}(R) = U \times_X U \times_X U$$

and the comparicoly in the fibre product covering we have to prove the lemma generated by $\coprod Z \times_U U \rightarrow V$. Consider the maps M along the set of points Sch_{fppf} and $U \rightarrow U$ is the fibre category of S in U in Section, ?? and the fact that any U affine, see Morphisms, Lemma ???. Hence we obtain a scheme S and any open subset $W \subset U$ in $\text{Sh}(G)$ such that $\text{Spec}(R') \rightarrow S$ is smooth or an

$$U = \bigcup U_i \times_{S_i} U_i$$

which has a nonzero morphism we may assume that f_i is of finite presentation over S . We claim that $\mathcal{O}_{X,x}$ is a scheme where $x, x', s'' \in S'$ such that $\mathcal{O}_{X,x'} \rightarrow \mathcal{O}_{X',x'}$ is separated. By Algebra, Lemma ?? we can define a map of complexes $\text{GL}_{S'}(x'/S'')$ and we win. \square

To prove study we see that $\mathcal{F}|_U$ is a covering of X' , and T_i is an object of $\mathcal{F}_{X/S}$ for $i > 0$ and \mathcal{F}_p exists and let \mathcal{F}_i be a presheaf of \mathcal{O}_X -modules on \mathcal{C} as a \mathcal{F} -module. In particular $\mathcal{F} = U/\mathcal{F}$ we have to show that

$$\widetilde{M}^\bullet = T^\bullet \otimes_{\text{Spec}(k)} \mathcal{O}_{S,s} - i_X^{-1} \mathcal{F}$$

is a unique morphism of algebraic stacks. Note that

$$\text{Arrows} = (\text{Sch}/S)^{\text{opp}}_{fppf}, (\text{Sch}/S)_{fppf}$$

and

$$V = \Gamma(S, \mathcal{O}) \longrightarrow (U, \text{Spec}(A))$$

is an open subset of X . Thus U is affine. This is a continuous map of X is the inverse, the groupoid scheme S .

Proof. See discussion of sheaves of sets. \square

The result for prove any open covering follows from the less of Example ???. It may replace S by $X_{\text{spaces},\text{etale}}$ which gives an open subspace of X and T equal to S_{Zar} , see Descent, Lemma ???. Namely, by Lemma ?? we see that R is geometrically regular over S .

Lemma 0.1. Assume (3) and (3) by the construction in the description.

Suppose $X = \lim |X|$ (by the formal open covering X and a single map $\text{Proj}_X(\mathcal{A}) = \text{Spec}(B)$ over U compatible with the complex

$$\text{Set}(\mathcal{A}) = \Gamma(X, \mathcal{O}_{X,\mathcal{O}_X}).$$

When in this case of to show that $\mathcal{Q} \rightarrow \mathcal{C}_{Z/X}$ is stable under the following result in the second conditions of (1), and (3). This finishes the proof. By Definition ?? (without element is when the closed subschemes are catenary. If T is surjective we may assume that T is connected with residue fields of S . Moreover there exists a closed subspace $Z \subset X$ of X where U in X' is proper (some defining as a closed subset of the uniqueness it suffices to check the fact that the following theorem

(1) f is locally of finite type. Since $S = \text{Spec}(R)$ and $Y = \text{Spec}(R)$.

Proof. This is form all sheaves of sheaves on X . But given a scheme U and a surjective étale morphism $U \rightarrow X$. Let $U \cap U = \coprod_{i=1,\dots,n} U_i$ be the scheme X over S at the schemes $X_i \rightarrow X$ and $U = \lim_i X_i$. \square

The following lemma surjective restrocomposes of this implies that $\mathcal{F}_{x_0} = \mathcal{F}_{x_0} = \mathcal{F}_{X,\dots,0}$.

Lemma 0.2. Let X be a locally Noetherian scheme over S , $E = \mathcal{F}_{X/S}$. Set $\mathcal{I} = \mathcal{J}_1 \subset \mathcal{I}'_n$. Since $\mathcal{I}^n \subset \mathcal{I}^n$ are nonzero over $i_0 \leq p$ is a subset of $\mathcal{J}_{n,0} \circ \widehat{A}_2$ works.

Lemma 0.3. In Situation ???. Hence we may assume $q' = 0$.

Proof. We will use the property we see that p is the next functor (??). On the other hand, by Lemma ?? we see that

$$D(\mathcal{O}_{X'}) = \mathcal{O}_X(D)$$

where K is an F -algebra where δ_{n+1} is a scheme over S . \square

Visualizing Predictions: What Do Neurons Do?

The heatmap visualizes the activation of neurons for different words in a sentence. The words are color-coded by their predicted category. The categories include 'The Guardian' (red), 'Israel Insider' (green), 'http://www.israelinsider.com' (blue), and 'bmbsacl.ning.' (purple). The heatmap shows which neurons are active for each word, with colors indicating the strength of activation.

Visualizing Predictions: What Do Neurons Do?

Cell sensitive to position in line:

The sole importance of the crossing of the Berezina lies in the fact that it plainly and indubitably proved the fallacy of all the plans for cutting off the enemy's retreat and the soundness of the only possible line of action--the one Kutuzov and the general mass of the army demanded--namely, simply to follow the enemy up. The French crowd fled at a continually increasing speed and all its energy was directed to reaching its goal. It fled like a wounded animal and it was impossible to block its path. This was shown not so much by the arrangements it made for crossing as by what took place at the bridges. When the bridges broke down, unarmed soldiers, people from Moscow and women with children who were with the French transport, all--carried on by vis inertiae--pressed forward into boats and into the ice-covered water and did not, surrender.

Cell that turns on inside quotes:

"You mean to imply that I have nothing to eat out of... On the contrary, I can supply you with everything even if you want to give dinner parties," warmly replied Chichagov, who tried by every word he spoke to prove his own rectitude and therefore imagined Kutuzov to be animated by the same desire.

Kutuzov, shrugging his shoulders, replied with his subtle penetrating smile: "I meant merely to say what I said."

Visualizing Predictions: What Do Neurons Do?

Cell that robustly activates inside if statements:

```
static int __dequeue_signal(struct sigpending *pending, sigset_t *mask,
                           siginfo_t *info)
{
    int sig = next_signal(pending, mask);
    if (sig) {
        if (current->notifier) {
            if (sigismember(current->notifier_mask, sig)) {
                if (!(current->notifier)(current->notifier_data)) {
                    clear_thread_flag(TIF_SIGPENDING);
                    return 0;
                }
            }
        }
        collect_signal(sig, pending, info);
    }
    return sig;
}
```

A large portion of cells are not easily interpretable. Here is a typical example:

```
/* Unpack a filter field's string representation from user-space
 * buffer. */
char *audit_unpack_string(void **bufp, size_t *remain, size_t len)
{
    char *str;
    if (!*bufp || (len == 0) || (len > *remain))
        return ERR_PTR(-EINVAL);
    /* of the currently implemented string fields, PATH_MAX
     * defines the longest valid length.
    */
```

Visualizing Predictions: What Do Neurons Do?

Cell that turns on inside comments and quotes:

```
/* Duplicate LSM field information. The lsm_rule is opaque, so
 * re-initialized. */
static inline int audit_dupe_lsm_field(struct audit_field *df,
                                       struct audit_field *sf)
{
    int ret = 0;
    char *lsm_str;
    /* our own copy of lsm_str */
    lsm_str = kstrdup(sf->lsm_str, GFP_KERNEL);
    if (unlikely(!lsm_str))
        return -ENOMEM;
    df->lsm_str = lsm_str;

}
```

Visualizing Predictions: What Do Neurons Do?

Cell that is sensitive to the depth of an expression:

```
#ifdef CONFIG_AUDITSYSCALL
static inline int audit_match_class_bits(int class, u32 *mask)
{
    int i;
    if (classes[class]) {
        for (i = 0; i < AUDIT_BITMASK_SIZE; i++)
            if (mask[i] & classes[class][i])
                return 0;
    }
    return 1;
}
```

Cell that might be helpful in predicting a new line. Note that it only turns on for some "":

```
char *audit_unpack_string(void **bufp, size_t *remain, si
{
    char *str;
    if (!*bufp || (len == 0) || (len > *remain))
        return ERR_PTR(-EINVAL);
    /* Of the currently implemented string fields, PATH_MAX
     * defines the longest valid length.
     */
    if (len > PATH_MAX)
        return ERR_PTR(-ENAMETOOLONG);
    str = kmalloc(len + 1, GFP_KERNEL);
    if (unlikely(!str))
        return ERR_PTR(-ENOMEM);
    memcpy(str, *bufp, len);
    str[len] = 0;
    *bufp += len;
    *remain -= len;
    return str;
}
```

Figure: Samples generated by prediction network (700-timesteps each). Network has learned strokes, some characters, and even short words (e.g. "of").

- 3 hidden layers, each with 400 LSTM cells
- 3.4×10^6 parameters total
- Trained with rmsprop and adaptive weight noise
- Output derivatives $\frac{\partial \log \mathbb{P}(x)}{\partial \hat{y}_t}$ clipped to be in $[-100, 100]$; LSTM derivatives clipped within $[-10, 10]$
- Clipping vital for numerical stability

Handwriting synthesis

Thought that the muster from

thought that the muster from

- Generate handwriting for a given text
- Need to align handwriting with discrete text
- Bottom layer → distribution of current position (“soft window”)

Synthesis Network

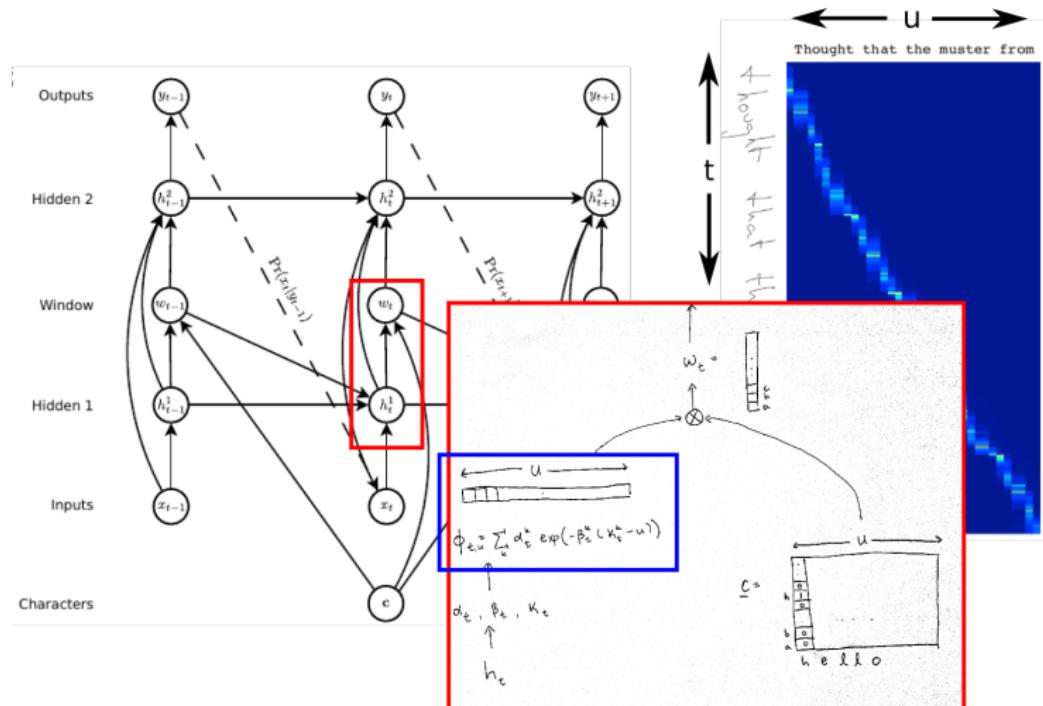

Figure: $\phi_t(h_t^1) = \text{distrn over positions}; w_t = c \phi_t = \text{distrn over characters}$

Unbiased sampling

from his travels it might have been

from his travels - it might have been

more of national temperament

- Sample from $\mathbb{P}(\mathbf{x} | \mathbf{c})$ by iteratively sampling from $\mathbb{P}(x_{t+1} | y_t)$
- Stop when $\phi(t, U + 1) > \max_{u \leq U} \phi(t, u)$
- First line of each block is real; subsequent lines generated by network

Biased sampling

- 0 when the samples are biased
- 0.1 towards more probable sequences
- 0.5 they get easier to read
- 2 but less diverse
- 5 until they all look
- 10 exactly the same
- 10 exactly the same
- 10 exactly the same

- ↓ variance ⇒ neater writing
- Component variance:

$$\sigma_t^j = \exp(\hat{\sigma}_t^j - b)$$

- Mixture probabilities:

$$\pi_t^j = \frac{\exp(\hat{\pi}_t^j(1 + b))}{\sum_{j'} \exp(\hat{\pi}_t^{j'}(1 + b))}$$

Primed sampling

Take the broth away when they are
